Firefighter Cancer is a Global Phenomenon

Cancer is a leading cause of death in firefighters.

Research has shown this is likely due to dermal exposure to harmful carcinogens such as polycyclic aromatic hydrocarbons, organophosphate flame retardants, polybrominated diphenyl ethers and metals.

- Dermal contact and off gassing are key carcinogen exposure risks to firefighters.
- Research has shown that decontaminating equipment reduces off gassing exposure risk
- DEKONMATE®'s unique formula is scientifically proven to reduce equipment exposure risks.

EQUIPMENT DECONTAMINATION WIPES

Product Information Sheet

Product Code: DEEW 5012
Soft Pack of 50 Wipes
Approx Size: 23cm x 33cm

What is off gassing?

Off gassing is when objects are contaminated with substances that leech ongoing gasses into the air and surrounding surfaces.

Firefighters' personal protective equipment (PPE) will become contaminated with various compounds during firefighting. Some of these compounds will off-gas following an incident, resulting in exposure to carcinogens.

Combined with the DEKONMATE® CONTAMINATION BAG we have adapted our original skin-safe wipe formula to create DEKONMATE® EQUIPMENT WIPES; providing a comprehensive, preventative system to reduce cancer-causing carcinogen contamination from Turnout Gear / BA Sets / Hoses and other contaminated items.

OHS RISKS

Learn how to reduce WHS risks by visiting our website

Workplace Health & Safety Liability

Regulations mandate you MUST REDUCE RISK WHERE REASONABLY PRACTICAL.

DEKONMATE® EQUIPMENT DECONTAMINATION WIPES are inexpensive and proven to reduce prolonged off gassing and dermal exposure risks.
